PROFILE

Graduating Computer Engineering student (3.59/4.00 GPA, ranked 2nd in department) with a strong foundation in AI systems, backend development, cloud infrastructure, and mobile game development. Proficient in Python, TypeScript, and C#, with a focus on applied AI and LLM systems. Driven by clean architecture at scale.

EDUCATION

Bahcesehir University

Istanbul, Turkey

Bachelor of Computer Engineering (GPA: 3.59/4.00)

Sept. 2022 – July 2026 (Expected)

- Ranked **2nd** in the Computer Engineering Department among 3rd-year students.
- Relevant Coursework: ATP - Applied LLMs, Deep Learning, Data Science with Python, AWS Cloud Computing.

EXPERIENCE

Software Development Intern

June 2025 – Aug. 2025

IFS Turkiye

Istanbul, Turkey

- Developed a real-time data visualization platform using **Node.js**, **Express.js**, and **MongoDB**.
- Optimized RESTful APIs and NoSQL schemas for high-performance data processing.
- Gained insight into large-scale ERP software lifecycles and industrial-grade development methodologies.

PROJECTS

ONYX - Agentic Market Intelligence System | *LangChain, Gemini, Python*

Spring 2026

- Designed and built a fully autonomous **LangChain ReAct agent** that collects live market data from Google Play, App Store, Steam, and Reddit simultaneously, producing structured analyst reports via Gemini Flash.
- Engineered a **weighted trend-scoring engine** ($\text{rank momentum} \times 0.4 + \text{review velocity} \times 0.3 + \text{Reddit sentiment} \times 0.3$) with a 7-day SQLite rolling snapshot system for delta-based signal calculation.
- Implemented an **LLM-as-a-Judge** self-evaluation loop: a second model instance grades every generated report against a 5-criteria rubric and triggers autonomous revision passes until quality threshold (0.7/1.0) is met.

MatchCut - Social Movie Recommendation Platform | *FastAPI, NestJS, PostgreSQL, Python*

Dec. 2025 – Present

- Built a **hybrid AI recommendation engine** combining SVD matrix factorization, item-item collaborative filtering, content-based similarity (TF-IDF + SentenceTransformers), and a cold-start module - served via FastAPI and integrated into a NestJS backend.
- Designed **adaptive weight scheduling** that shifts blending ratio from content-heavy (85%) to CF-dominant (75%) as user rating count grows, with exponential decay for cold-start anchoring.
- Automated weekly **SVD model retraining** via GitHub Actions CI/CD: merges MovieLens 25M with live PostgreSQL ratings, runs RMSE health checks, and hot-reloads the production container.

Press Tycoon Mobile Game | *Unity, C#*

Dec. 2025 – Present

- Engineered a lightweight **Dependency Injection (DI)** architecture and **Object Pooling** system, minimizing code coupling and optimizing runtime efficiency for mobile constraints.
- Developed a **data-driven, scalable** upgrade system utilizing interface-based service resolution (IMoneyService, etc.) and dynamic prefab generation for rapid iteration.
- Integrated **GameAnalytics SDK** to build dashboards, tracking in-game events, player funnels.

AWS Cloud Infrastructure Project | *AWS, VPC, ALB, ASG, S3*

Jan. 2026

- Designed a **high-availability** network using VPC and Private Subnets with NAT Gateways for secure isolation.
- Implemented **Application Load Balancers** and Auto Scaling Groups to ensure system uptime and **scalability**.

TECHNICAL SKILLS

Languages: C#, C++, JavaScript, TypeScript, Java, Python, SQL (Oracle, PostgreSQL), HTML/CSS

Frameworks & Engines: Node.js, Express.js, NestJS, FastAPI, LangChain, Unity Engine

Cloud & Tools: AWS (VPC, EC2, S3, ALB), Git, MongoDB, Docker, VS Code, Visual Studio

Extracurriculars: Co-Founder at BAU Piston Student Club | C-Level Licensed Motorsport Marshal (TOSFED) |

TEMA Foundation Volunteer
